

**PROBLEM 3.10** For water...

(a)  $p = 300 \text{ kPa}$ ,  $v = 0.5 \text{ m}^3/\text{kg}$ . Find  $T$  in  $^\circ\text{C}$ .

Table A-3,  $v_f = 1.0732/10^3 \text{ m}^3/\text{kg}$ ,  $v_g = 0.6058 \text{ m}^3/\text{kg}$ .  
 Since  $v_f < v < v_g$ , the state is in the two-phase, liquid-vapor region, as shown on the T-v diagram.  
 So,  $T = T_{\text{sat}}(3 \text{ bar}) = 133.6 \text{ }^\circ\text{C}$ .

← T

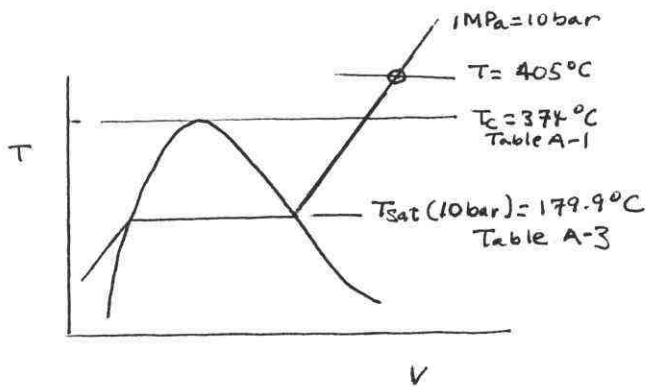

(b)  $p = 28 \text{ MPa}$ ,  $T = 200 \text{ }^\circ\text{C}$ . Find  $v$  in  $\text{m}^3/\text{kg}$ .

State is in liquid region. From Table A-5,  
 @  $200 \text{ }^\circ\text{C}$   $v = \frac{1.1344}{10^3}$   $v = \frac{1.1302}{10^3}$   
 So, at 280 bar  
 $v \approx \frac{1.1319}{10^3} \frac{\text{m}^3}{\text{kg}}$

← v

(c)  $p = 1 \text{ MPa}$ ,  $T = 405 \text{ }^\circ\text{C}$ . Find  $v$  in  $\text{m}^3/\text{kg}$ .

From Table A-4 at 10 bar, interpolation gives  
 $v = 0.309 \text{ m}^3/\text{kg}$

← v

(d)  $T = 100 \text{ }^\circ\text{C}$ ,  $x = 60\%$ . Find  $v$  in  $\text{m}^3/\text{kg}$ .

Eq. 3.2:  
 $v_x = (1-x)v_f + xv_g$   
 with data from Table A-2 at  $100 \text{ }^\circ\text{C}$ ,  
 $v_x = 0.4 \left[ \frac{1.0435}{10^3} \right] + 0.6 \left[ 1.673 \right]$   
 $= 1.0042 \text{ m}^3/\text{kg}$

← v
